

AI INNOVATORS PATHWAY

AI Entrepreneurship and Innovation

Teacher Implementation Guide and Six-Lesson Pilot Module

6

Project-Based Lessons

9-12

Grade Range

1

Final Innovation Pitch

For business, entrepreneurship, computer science, CTE, career education, and interdisciplinary settings

Pilot Edition | Grades 9-12

Future Ready AI

Learn. Create. Lead.

How to Use This Guide

This pilot-ready module helps students investigate a real business or community challenge, determine whether AI has an appropriate role, design a responsible concept, and pitch a realistic next step. The sequence is designed for six class meetings and can be taught without requiring students to use a generative AI tool.

Important positioning: This resource is designed for local review and adaptation. It is not described as district-approved or standards-approved. Educators and school leaders should confirm local curriculum, technology, privacy, accessibility, and student-research requirements before implementation.

Curriculum Architecture

The architecture comes first: each lesson produces one artifact required for the final community or business challenge.

Lesson	Learning focus	Student evidence	Time
1. What Makes a Problem Worth Solving?	Problem framing and opportunity selection	Problem statement + worth-solving scorecard	60 min
2. Customer and Community Discovery	Listening, evidence, and stakeholder perspectives	Discovery notes + evidence summary	60 min
3. How Can AI Support the Solution?	AI fit, inputs/outputs, limits, and human oversight	AI role map + concept storyboard	60 min
4. Value Proposition and Business Model	Value creation, beneficiaries, resources, and sustainability	Value proposition + simple business-model canvas	60 min
5. Responsible Innovation: Privacy, Bias, Access, and Harm	Risk review, safeguards, transparency, and accountability	Responsible AI risk review + revised concept	60 min
6. Build and Pitch the Solution	Prototype communication, feedback, and persuasive pitching	Prototype + pitch + reflection	60-90 min

Learning Objectives

- Distinguish a meaningful, researchable problem from a vague complaint or technology-first idea.
- Gather and synthesize customer or stakeholder evidence without collecting unnecessary personal information.
- Explain a specific, limited role AI could play in a solution and identify tasks that should remain human-led.
- Create a clear value proposition and a simple, realistic business or community-impact model.
- Evaluate privacy, bias, access, transparency, and harm risks and propose practical safeguards.
- Develop a low-fidelity prototype or concept model and communicate how the solution works.
- Deliver an evidence-based pitch that makes human accountability, limitations, and next steps explicit.
- Reflect on feedback, responsible innovation, career connections, and individual contribution.

Recommended Pacing

Format	Recommended schedule	Adaptation
Standard pilot	Six 60-minute periods	Use a gallery pitch or add a seventh showcase period.
Block schedule	Three 90-minute blocks	Combine Lessons 1-2, 3-4, and 5-6.
Intensive sprint	Two half-days plus showcase	Assign discovery between sessions.
Extended pathway	8-12 periods	Add deeper interviews, prototype testing, budgeting, and mentor feedback.

Final Community or Business Challenge

Student teams design an AI-supported response to a verified school, community, business, or career-related challenge. The goal is not to build a functioning AI product. The goal is to demonstrate disciplined problem discovery, appropriate technology selection, responsible design, and persuasive communication.

Required final evidence

- A specific problem statement supported by discovery evidence.
- At least three discovery data points, such as two brief conversations plus one observation, profile analysis, or anonymous survey response set.
- A clear explanation of the AI-supported task, inputs, outputs, limitations, verification, and human decision points.
- A value proposition and completed simple business-model canvas.
- A responsible AI review covering privacy, bias/fairness, access, transparency, harm/misuse, safeguards, appeal, monitoring, and human accountability.
- A low-fidelity prototype or concept model.
- An eight-slide pitch and 3-5 minute presentation.
- An individual post-assessment and reflection.

Challenge guardrail: Students should not collect confidential or sensitive personal data, diagnose individuals, make high-stakes decisions, impersonate people, or deploy an unreviewed AI system. Any external outreach should be teacher-approved.

Assessment System

When	Assessment	Purpose	Evidence
Before Lesson 1	Pre-assessment	Establish baseline understanding and misconceptions.	12 multiple-choice items + 2 short responses
Lessons 1-5	Formative artifact	Guide feedback and determine	Problem, discovery, AI role, canvas, risk review

When	Assessment	Purpose	Evidence
	checks	readiness to continue.	
Lesson 6	Final performance rubric	Evaluate integrated application and communication.	Prototype, pitch, Q&A, supporting artifacts
After pitch	Post-assessment	Measure learning growth using parallel competencies.	12 multiple-choice items + 2 short responses
After pitch	Individual reflection	Capture judgment, learning, feedback, and contribution.	Written or recorded response

Required Teacher and Student Materials

- Teacher implementation guide and lesson plans
- Student workbook (print or digital)
- Presentation display and timer
- Sticky notes, chart paper, index cards, markers, and plain paper
- Optional prototyping tools: slides, drawing software, wireframing tools, spreadsheet, or no-code platform
- Optional teacher-approved AI tool; the module can be completed without student access to generative AI
- Local acceptable-use, privacy, academic-integrity, and media-release guidance
- Pitch deck template and final performance rubric

Teacher Implementation Guide

Before the pilot

1. Choose the course context, class schedule, team size, and whether the challenge will be open choice or selected from a teacher-approved challenge bank.
2. Review local policies for AI tools, student accounts, data privacy, accessibility, academic integrity, internet filtering, and community contact.
3. Decide whether AI tools will be demonstrated by the teacher, used by students with permission, or discussed conceptually only.
4. Identify possible audiences such as peers, educators, local entrepreneurs, nonprofit leaders, CTE advisory members, or families.
5. Prepare print or digital workbooks and the pitch template. Confirm presentation access and an offline backup.

Suggested challenge bank

- Helping students find reliable school resources without exposing private information.
- Reducing food, supply, time, or energy waste in a school or small business.
- Improving access to community programs for people with different languages, abilities, schedules, or connectivity.

- Supporting local entrepreneurs with customer communication, inventory planning, or routine administrative work.
- Helping a community organization understand non-sensitive service trends while protecting participant privacy.
- Improving career exploration while avoiding stereotypes and keeping counselors and students in control.

Responsible AI classroom norms

- Begin with people and evidence, not with a tool.
- Use only teacher-approved tools and accounts.
- Never enter confidential, identifying, copyrighted, or sensitive information into an AI system.
- Verify important claims with reliable sources or direct evidence.
- Disclose meaningful AI assistance according to local expectations.
- Keep humans responsible for decisions, approvals, appeals, and consequences.
- Limit or remove AI when risk is disproportionate to benefit.

Inclusion, accessibility, and differentiation

- Offer curated challenges and stakeholder profiles for students who need additional structure.
- Allow speech-to-text, audio reflection, visual prototypes, scribing, and alternative presentation roles.
- Provide vocabulary previews, models, sentence frames, chunked tasks, and extended time.
- Design teams with meaningful roles: discovery lead, solution designer, responsibility lead, prototype lead, and pitch lead.
- Avoid framing communities only through deficits. Ask about strengths, assets, current expertise, and existing solutions.
- Ensure prototypes consider language, disability, device access, connectivity, and cultural context.

Using AI tools during the module

Use case	Appropriate practice	Human accountability
Brainstorming	Generate options after discovery; compare with non-AI options.	Students select, revise, and justify.
Summarizing notes	Use only de-identified, non-sensitive notes if locally permitted.	Students verify themes against originals.
Prototype copy	Draft labels or examples without personal data.	Students review accuracy, tone, accessibility, and bias.
Pitch practice	Generate possible questions or rehearse responses.	Students own claims and disclose assistance when required.

Lesson 1: What Makes a Problem Worth Solving?

Essential question: How do innovators decide which problems deserve time, attention, and resources?

Learning objectives

- Identify observable problems in school, community, business, or career settings.
- Use evidence, impact, frequency, urgency, and feasibility to evaluate an opportunity.
- Write a human-centered problem statement without jumping to a solution.

Key vocabulary

problem statement, root cause, evidence, impact, feasibility, assumption

Teacher preparation

Select one familiar example problem. Decide whether students will choose from a teacher-approved challenge bank or propose their own. Review local rules for student research.

Lesson sequence

Phase	Minutes	Teacher and student actions
Launch	0-8	Show two ideas: a flashy AI app with no clear user need and a simple solution to a verified problem. Students vote and justify which is more valuable.
Mini-lesson	8-18	Model the difference between a symptom, a root cause, and a solution. Introduce the Worth-Solving Test: real, specific, recurring, consequential, researchable, and feasible.
Opportunity scan	18-33	Students list problems they notice in school, community, work, or daily life. They avoid naming a technology or solution.
Score and select	33-48	Teams score three candidate problems using evidence, impact, frequency, access to stakeholders, and scope. They select one or revise it.
Problem statement	48-56	Teams write: [People] experience [specific problem] in [context], resulting in [impact], as shown by [current evidence or what we still need to learn].
Exit check	56-60	One-minute defense: Why is this problem worth investigating, and what assumption must be tested next?

Facilitation prompts

- What evidence shows this problem is real?
- Who experiences it differently?
- Are we naming a problem or disguising a solution?
- What is small enough to learn about during this pilot?

Teacher look-fors

- The statement names people and context rather than 'everyone.'
- The problem is not written as 'people need our app.'
- Students distinguish observed evidence from assumptions.
- The scope is small enough for a six-lesson pilot.

Supports and extensions

Offer a curated challenge bank, sentence frames, visual examples, and paired reading. Extend advanced learners by asking them to compare root causes or define success measures.

Student deliverable: Problem statement and Worth-Solving Scorecard.

Lesson 2: Customer and Community Discovery

Essential question: What can we learn by listening before designing?

Learning objectives

- Differentiate customers, users, beneficiaries, decision-makers, and affected stakeholders.
- Develop neutral discovery questions that invite stories rather than approval.
- Synthesize evidence into needs, current workarounds, barriers, and design criteria.

Key vocabulary

customer, user, beneficiary, stakeholder, interview, observation, insight, bias

Teacher preparation

Arrange safe access to peers, staff, family/community adults, or teacher-provided interview profiles. Require teacher approval before outreach. Do not collect names, contact details, health data, grades, immigration status, financial details, or other sensitive information.

Lesson sequence

Phase	Minutes	Teacher and student actions
Warm-up	0-7	Students compare 'Would you use our AI app?' with 'Tell me about the last time this problem occurred.' Identify which question produces better evidence.
Mini-lesson	7-18	Map the stakeholder ecosystem and model open, neutral questions. Discuss consent, privacy, respectful listening, and how to record themes without identifying people.
Plan	18-28	Teams choose 2-3 stakeholder groups and draft six discovery questions.
Discover	28-45	Students conduct brief peer interviews, analyze teacher-provided profiles, or complete a structured observation.
Synthesize	45-55	Teams sort evidence into: what people do now, pain points, desired outcomes, constraints, and contradictions.
Exit check	55-60	Teams name one insight that changed or challenged their original assumption.

Facilitation prompts

- What did you hear more than once?
- What surprised you?
- Whose perspective is still missing?
- What information should we intentionally not collect?

Teacher look-fors

- Questions ask about actual experiences rather than hypothetical praise.
- Notes omit personally identifying or sensitive information.
- Teams identify contradictions instead of averaging away differences.
- Insights are connected to evidence, not a single quote treated as proof.

Supports and extensions

Use role cards or prewritten stakeholder profiles when live interviews are not practical. Allow audio response, scribing, or teacher conferencing. Extend by comparing differences across stakeholder groups.

Student deliverable: Discovery plan, anonymized notes, and Evidence-to-Insight Summary.

Lesson 3: How Can AI Support the Solution?

Essential question: Where does AI add value—and where should it not be used?

Learning objectives

- Identify whether a proposed task involves pattern recognition, prediction, recommendation, generation, or classification.
- Compare an AI-supported approach with simpler non-AI alternatives.
- Define inputs, outputs, limitations, verification, and human decision points.

Key vocabulary

input, output, training data, inference, automation, generative AI, confidence, verification, human-in-the-loop

Teacher preparation

Prepare one example showing appropriate AI support and one example where a checklist, search, database, or human service is safer or simpler. Student use of AI tools is optional.

Lesson sequence

Phase	Minutes	Teacher and student actions
AI or not?	0-10	Students sort solution tasks into: AI may help, ordinary software is enough, and human judgment is essential.
Mini-lesson	10-22	Explain common AI functions and limitations. Emphasize that AI can produce plausible errors and that a solution should use the least complex technology that works.
AI Fit Test	22-35	Teams evaluate whether AI is necessary, useful, realistic, and proportionate to the problem.
Role map	35-48	Teams map input -> AI-supported task -> output -> human review -> action. They identify what the system must never decide alone.
Concept storyboard	48-56	Teams sketch 4-6 frames showing how a person experiences the solution.
Exit check	56-60	Complete: 'AI supports our solution by _____. A person remains responsible for _____.'

Facilitation prompts

- What exact task would AI perform?
- Could a rule, search, checklist, or human service work better?
- How could the output be wrong?
- Who reviews it before action?

Teacher look-fors

- AI has a specific job, not a vague promise to 'make it smarter.'
- Inputs are lawful, necessary, and realistic to obtain.
- Teams identify verification and fallback steps.
- A non-AI option is considered before adding AI.

Supports and extensions

Provide an AI-function card set and a partially completed workflow. Permit paper storyboards. Extend by identifying failure modes and designing a non-AI fallback.

Student deliverable: AI Fit Test, AI Role Map, and concept storyboard.

Lesson 4: Value Proposition and Business Model

Essential question: How will the solution create value and remain workable?

Learning objectives

- Write a value proposition grounded in stakeholder evidence.
- Identify users, beneficiaries, partners, resources, costs, channels, and success measures.
- Select a realistic sustainability model for a business or community-impact concept.

Key vocabulary

value proposition, customer segment, channel, partner, cost, revenue, sustainability, impact measure

Teacher preparation

Choose one sample business and one nonprofit/community solution. Highlight that 'business model' means how value is created, delivered, and sustained—not only how money is made.

Lesson sequence

Phase	Minutes	Teacher and student actions
Value test	0-8	Students identify which of three value propositions is specific, evidence-based, and meaningful.
Mini-lesson	8-20	Model the formula: For [specific people] who [need/problem], our [solution] helps them [benefit] by [how], unlike [current alternative].
Draft and test	20-32	Teams draft two versions and test them with another team using 'clear, credible, compelling.'
Business-model canvas	32-50	Teams complete the nine-part simple canvas: problem, people, value, solution/AI role, channels, partners/resources, costs, sustainability, and success measures.
Reality check	50-57	Teams identify the riskiest assumption and one low-cost way to test it.
Exit check	57-60	Each student explains how the model creates value for both the user and the organization/community.

Facilitation prompts

- What outcome matters to the user?
- Why would anyone change from the current option?
- What must exist for this to work?
- How will the solution be sustained?

Teacher look-fors

- The value proposition names a concrete outcome.
- The model distinguishes user benefit from organizational value.
- Costs and resources are plausible for a pilot.
- Success measures include quality or impact—not only number of users.

Supports and extensions

Use sentence frames and sample canvases. Allow teams to complete a reduced six-box version. Extend by estimating unit cost, break-even, or social-return indicators.

Student deliverable: Tested value proposition and simple business-model canvas.

Lesson 5: Responsible Innovation: Privacy, Bias, Access, and Harm

Essential question: How can we improve the idea before risks become real-world harm?

Learning objectives

- Identify privacy, bias/fairness, access, transparency, safety, and misuse risks.
- Evaluate likelihood, severity, who is affected, and whether the risk is acceptable.
- Add safeguards, human review, appeal, monitoring, and a non-AI fallback.

Key vocabulary

privacy, data minimization, bias, fairness, accessibility, transparency, harm, safeguard, accountability, appeal

Teacher preparation

Review local policy. Select one age-appropriate scenario. Make clear that a risk review is a design responsibility, not a promise that risk can be eliminated.

Lesson sequence

Phase	Minutes	Teacher and student actions
Scenario	0-10	Analyze a solution that helps many users but disadvantages people with limited internet access. Ask: useful for whom, difficult for whom, and who decides?
Mini-lesson	10-22	Introduce the Responsible Innovation Review: purpose, data, bias/fairness, access, harm/misuse, transparency, human accountability, appeal, monitoring.
Risk scan	22-38	Teams identify risks and rate likelihood and severity. They name affected groups and supporting evidence or uncertainty.
Safeguard sprint	38-50	Teams add data minimization, inclusive testing, accessibility, disclosure, human review, escalation, appeal, monitoring, and fallback controls as appropriate.
Red-team review	50-57	Another team challenges the concept: 'How might this fail, exclude, mislead, or be misused?' Designers respond by revising—not defending—the concept.
Exit check	57-60	Name the highest remaining risk, the human owner, and the launch condition that must be met.

Facilitation prompts

- Who bears the risk if the system fails?
- What data is truly necessary?
- How can someone question or appeal an outcome?
- What would make you pause or remove this feature?

Teacher look-fors

- Teams name who could be affected, not only abstract technical risks.
- Safeguards change the design or process.
- Human review includes authority, training, and a response path.
- Teams are willing to limit, pause, or reject an AI feature.

Supports and extensions

Use risk cards and color-coded prompts. Offer scenarios for students who need more structure. Extend by defining monitoring indicators and stop-use thresholds.

Student deliverable: Responsible AI Risk Review and revised solution concept.

Lesson 6: Build and Pitch the Solution

Essential question: How can we show that the idea is useful, responsible, and ready for a next test?

Learning objectives

- Create a low-fidelity prototype that communicates the user experience or workflow.
- Deliver an evidence-based pitch with value, feasibility, safeguards, and accountability.
- Use feedback and reflection to identify a responsible next step.

Key vocabulary

prototype, test, iteration, evidence, pitch, call to action, feedback

Teacher preparation

Choose pitch length (3-5 minutes), form teams, arrange audience/feedback, print rubrics, and test presentation access. A functioning AI product is not required.

Lesson sequence

Phase	Minutes	Teacher and student actions
Build sprint	0-20	Teams complete a paper prototype, storyboard, clickable mockup, workflow demonstration, service blueprint, or concept model.
Test	20-30	A peer uses the prototype while the team observes. The team records one confusion, one strength, and one revision.
Pitch preparation	30-43	Teams complete the eight-slide pitch template: problem, discovery, solution, AI role, value, model, responsibility, prototype/ask.
Pitch showcase	43-70	Teams deliver 3-5 minute pitches and respond to questions. For a 60-minute period, use gallery pitches or split the showcase across two days.
Reflection	70-80	Students complete individual reflection and post-assessment.
Close	80-90	Audience names promising evidence, responsible safeguards, and next-test recommendations.

Facilitation prompts

- What did discovery change?
- What does the prototype prove—and not prove?
- Who remains accountable?
- What is the smallest responsible next test?

Teacher look-fors

- The prototype shows how a user experiences the concept.
- Claims are connected to discovery evidence.
- The pitch states both AI value and AI limitations.
- The team names the accountable human role and a realistic next test.

Supports and extensions

Allow recorded or live pitches, assigned presentation roles, visual response, captioning, and rehearsal. Extend through mentor feedback, cost estimates, or a second prototype iteration.

Student deliverable: Prototype, pitch deck, team presentation, post-assessment, and individual reflection.

Final Project Performance Rubric

Criterion	4 - Advanced	3 - Proficient	2 - Developing	1 - Beginning
Problem and evidence	Problem is specific, consequential, scoped, and supported by multiple credible discovery data points.	Problem is clear and supported by some evidence; scope or root cause needs refinement.	Problem is broad, solution-led, or supported mainly by assumptions.	Problem and evidence are missing or disconnected.
Stakeholder discovery	Multiple perspectives are represented; insights, contradictions, and constraints directly shape the design.	Relevant perspectives are included and influence some design choices.	Limited discovery is summarized but weakly connected to design.	Little or no stakeholder evidence is presented.
AI fit and human oversight	AI has a precise, justified role; alternatives, limitations, verification, fallback, and human authority are clear.	AI role and human review are mostly clear, with minor gaps.	AI role is vague or unnecessary; oversight is named but not operational.	AI is used as a slogan or replaces accountable human judgment.
Value proposition and model	Value is specific and evidence-based; users, delivery, resources, costs, sustainability, and success measures are coherent.	Core value and model are plausible, with some missing detail.	Value or model is generic, incomplete, or weakly supported.	No workable value proposition or model is shown.
Responsible innovation	Privacy, bias, access, transparency, harm, misuse, appeal, and monitoring are evaluated; safeguards change the design.	Major risks and safeguards are addressed; some areas need depth.	Risks are listed but safeguards are general or disconnected.	Risks are minimized, ignored, or shifted to users.
Prototype and testing	Prototype clearly demonstrates the experience or workflow; feedback produces a documented revision.	Prototype communicates the main concept and receives feedback.	Prototype is partial, confusing, or not tested.	No usable prototype or concept model is presented.
Pitch and response	Pitch is clear, persuasive, evidence-based, appropriately paced, and candid about limits; Q&A shows sound judgment.	Pitch communicates the idea and evidence with minor clarity or pacing gaps.	Pitch relies on claims more than evidence or omits key components.	Pitch is incomplete, unclear, or unsupported.
Collaboration and reflection	Roles, decisions, contribution, feedback, and next steps are documented thoughtfully.	Most team members contribute and reflection identifies learning.	Contribution or reflection is uneven or superficial.	Collaboration evidence and reflection are missing.

Suggested scoring: 32 points total. Recommended proficiency benchmark: 24 points, with no score below 2 in AI fit/human oversight or responsible innovation.

Pre-/Post-Assessment Scoring Guide

Selected-response answer key

Use the same competency set before and after instruction. Score one point per selected-response item.

1. A team starts by choosing a chatbot and then searches for a problem. What should it do first?

- A. Add more AI features
- B. Identify and investigate a specific human need
- C. Create a logo

- D. Estimate advertising revenue

Answer: B

2. Which discovery question is most likely to produce useful evidence?

- A. Would you buy our solution?
- B. Do you like AI?
- C. Tell me about the last time this problem happened.
- D. Is our idea innovative?

Answer: C

3. A stakeholder is best described as:

- A. Only the person who pays
- B. Anyone who may affect or be affected by the solution
- C. Only the technical developer
- D. A person who already agrees with the team

Answer: B

4. When is AI most appropriate?

- A. Whenever it makes a pitch sound modern
- B. When a clearly defined task benefits from pattern recognition, prediction, recommendation, classification, or generation
- C. Whenever ordinary software would work
- D. When no human can review the result

Answer: B

5. Which statement about AI output is most accurate?

- A. It is always objective
- B. It should be trusted when it sounds confident
- C. It may be useful but still requires verification and context
- D. It removes the need for accountability

Answer: C

6. A strong value proposition identifies:

- A. Only the product name
- B. The people, their need, the benefit, and how the solution differs from current options
- C. Every possible feature
- D. The team's favorite technology

Answer: B

7. A simple business model explains:

- A. Only how much money investors receive
- B. How value is created, delivered, resourced, and sustained
- C. Only the color and style of the product
- D. Why no partners are needed

Answer: B

8. Which practice best protects privacy?

- A. Collect all available data in case it becomes useful
- B. Use the minimum necessary data and define who can access it
- C. Hide data use in fine print
- D. Keep data forever

Answer: B

9. Bias risk can occur when:

- A. Data or design choices underrepresent people or reproduce unequal patterns
- B. A system processes information quickly
- C. A prototype uses paper
- D. A team receives feedback

Answer: A

10. Which is an access consideration?

- A. Whether users have the language, device, connectivity, ability, and support needed to use the solution
- B. Whether the logo is memorable
- C. Whether the pitch has animation
- D. Whether the team uses technical vocabulary

Answer: A

11. Human oversight is meaningful when:

- A. A person is listed but cannot change the result
- B. A trained person has authority, information, and a clear process to review or override the system
- C. The system makes every decision automatically
- D. Users are told to accept the output

Answer: B

12. If the highest-risk feature cannot be adequately safeguarded, the team should:

- A. Launch quickly
- B. Hide the limitation
- C. Limit, redesign, pause, or remove the feature
- D. Collect more personal data

Answer: C

Short-response scoring

Score	AI role and limitation	Human accountability
2	Names a specific AI-supported task and a credible limitation or verification need.	Names a specific human role with authority, review information, and a response/override path.
1	Names an AI use or limitation, but explanation is vague or incomplete.	States that a human should review but does not explain authority or process.
0	Response is missing, inaccurate, or treats AI as automatically correct.	Response removes human responsibility or is missing.

Total assessment score: 16 points. Compare class and individual pre/post results by competency; do not use the pre-assessment as a graded measure of prior access or experience.

Pilot Evidence and Teacher Reflection

- Which lesson artifacts showed the strongest student growth?
- Where did students confuse AI capability with AI appropriateness?
- Whose perspectives were easy or difficult to include?
- Which privacy, bias, access, or harm risks did students initially overlook?
- What schedule, scaffolds, policies, or community partnerships should change before the next pilot?
- What evidence can be shared without exposing student identity or sensitive information?

Pilot mindset: Treat this module as a learning cycle. Collect feedback, revise materials, and confirm local approvals before expanding.
